Antenna Theory: Analysis and Design

Author: Constantine A. Balanis

If all accelerating electric charges radiate, then the wires that connect my computer to the wall should be antennas, correct?

Answer is **yes**. However, they are very poor antennas as the radiation is cancelled over two wires carrying current in the opposite directions.

If it is so simple, then everything could be an antenna. Why don't we just use a metal paper clip as an antenna, hook it up to the receiver ?

Answer: A paper clip could act as an antenna for some given conditions. The impedance controls how much power the receiver or transmitter could deliver to the paper clip. Impedance depends on the operating frequency.

## Antennas

1.1 Introduction

1.2 Types of Antennas

# What is antenna?

## Definition :

“a means for radiating or receiving radio waves.”

Transitional structure between free-space and a guiding device

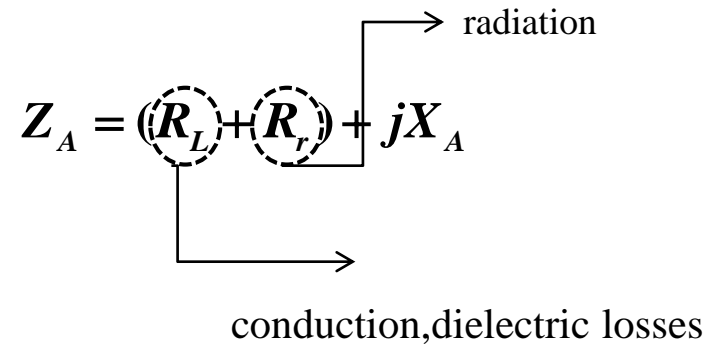

**Figure 1.1** Antenna as a transition device.

**Figure 1.2** Transmission-line Thevenin equivalent of antenna in transmitting mode.

**Figure 1.2** Transmission-line Thevenin equivalent of antenna in transmitting mode.

Maximum power is delivered to the antenna under *conjugate matching*.

$$\mathbf{R_r + R_L = R_g, X_A = -X_g}$$

# What are not antennas?

compass

only receiving magnetic field

# What about human eyes?

The human eye of course receives high frequency electromagnetic waves but cannot transmit waves.

Therefore, eyes are not the antenna.

1834-1879

Nikola **Tesla**  
1865-1943

# Coupling of electricity and magnetism

Michael Faraday  
1791-1867

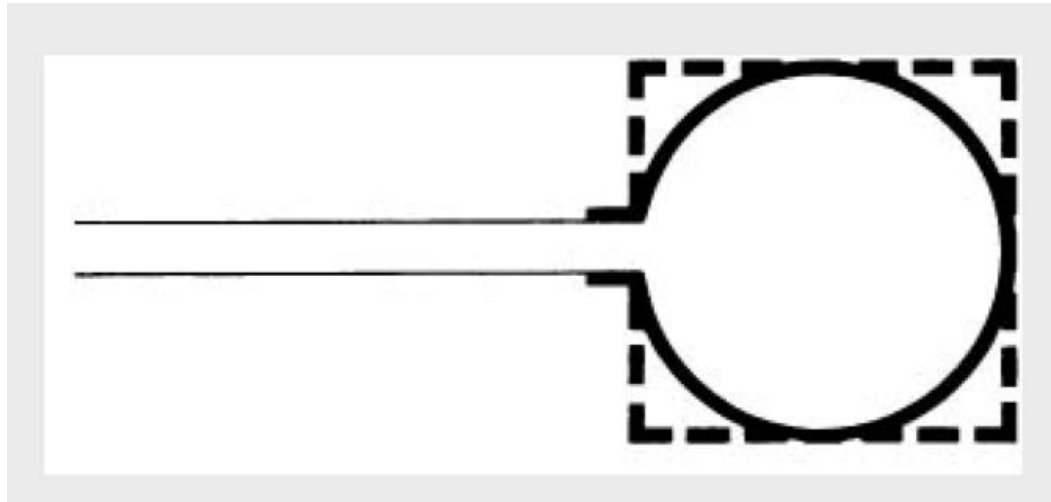

He slid a magnetic around the coils of a wire attached to a galvanometer.

In moving the magnet, he was creating a time-varying magnetic field, which as a result (from Maxwell's Equations), must have had a time-varying electric field.

# The coil acts as a loop antenna.

It receives the EM radiation which is detected by the ampere meter.

# Hertz's wireless communication system

Heinrich Hertz  
1857-1894

He observed an electrical spark in the gap of a dipole antenna.

When using a loop antenna as a receiver, he observed a similar disturbance.

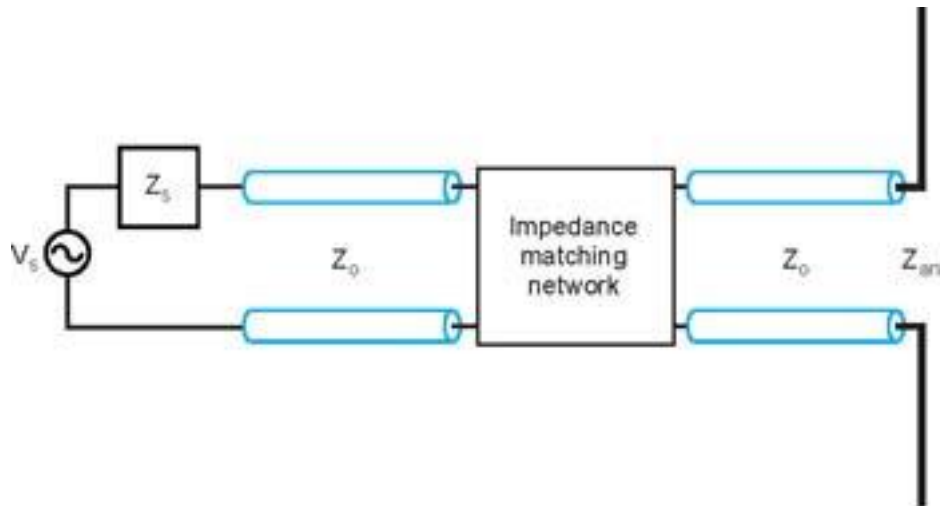

# Dipole antenna

# Generic Antenna network

- Complex antenna impedance  $Z_{ant}$  needs to be matched to the system impedance.

# Types Of Antennas

1. Wire antennas
2. Aperture antennas
3. Microstrip antennas
4. Array antennas
5. Reflector antennas
6. Lens antennas

# Aperture antennas

- Horn antennas have a directional **radiation pattern** with a high antenna gain, 10-20 dB is typical.
- Horn antennas are also often used to feed a dish antenna, or as a "standard gain" antenna in measurements.
- The popular design is pyramidal horn.

Antennas

# Radiation mechanisms

How is the radiation accomplished in a single wire?

Charge Uniformly Distributed  
in a Circular Cross Section Cylinder

**Fig. 1.9**

# Single wire

- Assume  $\rho_v$  is an electric volume charge density ( $\text{C}/\text{m}^3$ ) and is uniformly distributed in a circular wire of a cross-sectional  $A$  and volume  $V$ .
- The current density  $J_z = \rho_v v_z$   $\text{A}/\text{m}^2$  is called “*convection current.*”
- The current density  $J_s$  on the surface is given by  $J_s = \rho_s v_z$

where  $\rho_s$  is the surface charge density ( $\text{C}/\text{m}^2$ ).

If the wire is very thin, then the current can be represented by  $I_s = \rho_l v_z$ , where  $\rho_l$  is the charge per unit length ( $\text{C}/\text{m}$ ).

# Single wire

$$\frac{dI_z}{dt} = \rho_l \frac{dv_z}{dt} = \rho_l a_z$$

$$l \frac{dI_z}{dt} = l \rho_l \frac{dv_z}{dt} = l \rho_l a_z$$

To create radiation, there must be a time-varying current or an acceleration (or deceleration) of charge).

# Radiation facts

1. If a charge is not moving , current is not created and there is no radiation.
2. If charge is moving with a uniform velocity:
  - a) There is no radiation if the wire is straight, and infinite in extent.
  - b) There is a radiation if the wire is curved, bent, discontinuous, terminated, or truncated.
3. If charge is oscillating in a time-motion, it radiates even if the wire is straight.

Chapter 1  
*Antennas*

# Two wires

- Applying a voltage source connected to a two-conductor transmission line which is connected to an antenna.

(a) Antenna and electric field lines

(b) Antenna and free-space wave

**Figure 1.11** Source, transmission line, antenna, and detachment of electric field lines.

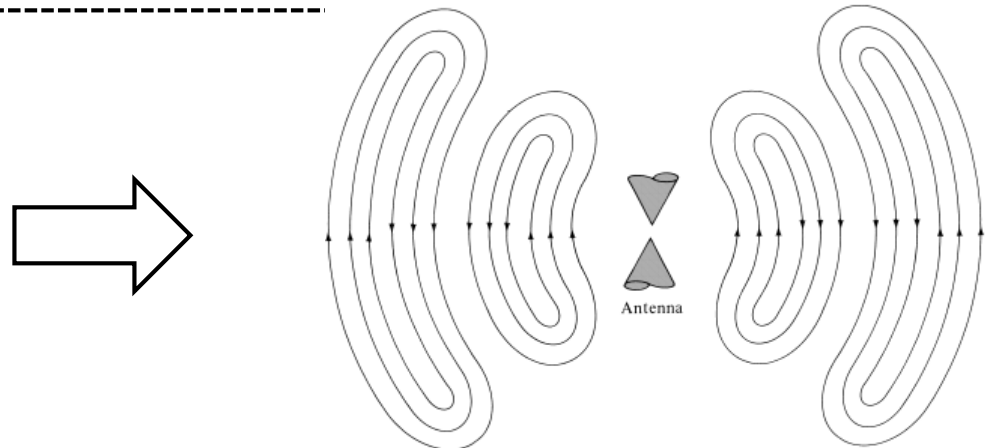

# Dipole

The electric lines of force are detached from the antenna to form the free-space waves.

- If the disturbance persists, new waves are continuously created which lag in their travel behind the others.

- There is no net charge on the antenna, then the lines of force must have been forced to detach themselves from the conductors and to unite together to form closed loops.

# E-Field Lines Of $\lambda/2$ Dipole

$t=0$

$t=T/8$

$t=T/4$

$t=3T/8$
