

# Digital Image Processing and Pattern Recognition

E1528

Fall 2022-2023

Lecture 2

## DIP Fundamentals & MATLAB Tutorials

**INSTRUCTOR**

**DR / AYMAN SOLIMAN**

## ➤ Contents

- Introduction to Digital Image Processing
- Digital Image Processing Fundamentals
- Introduction to MATLAB
- Working with MATLAB

## ➤ What is Digital Image Processing?

- An image may be defined as a two-dimensional function,  $f(x, y)$ , where  $x$  and  $y$  are spatial (plane) coordinates, and the amplitude of  $f$  at any pair of coordinates  $(x, y)$  is called the intensity or gray level of the image at that point.
- When  $x$ ,  $y$ , and the amplitude values of  $f$  are all finite, discrete quantities, we call the image a digital image.
- The field of digital image processing refers to processing digital images by means of a digital computer.

## ➤ **What is Digital Image Processing? (cont.)**

- a digital image is composed of a finite number of elements, each of which has a particular location and value. These elements are referred to as **picture elements**, **image elements**, **pels**, and **pixels**.
- **Pixel** is the term most widely used to denote the elements of a digital image.

## ➤ **The Origins of Digital Image Processing**

- One of the first applications of digital images was in the **newspaper industry**, when pictures were first sent by submarine cable between London and New York.
- Some of the initial problems in improving the **visual quality** of these early digital pictures were related to **the selection of printing procedures** and the **distribution of intensity levels**.

## ➤ Examples of Fields that Use Digital Image Processing

- Today, there is almost no area of technical endeavor that is not impacted in some way by digital image processing.
- Images based on radiation from the **EM** spectrum are the most familiar, especially images in the **X-ray** and **visual bands** of the spectrum.
- Electromagnetic waves can be conceptualized as propagating sinusoidal waves of varying wavelengths, or they can be thought of as a stream of **massless particles**, each traveling in a wavelike pattern and moving at the **speed of light**. Each massless particle contains a certain amount (or **bundle**) of energy. Each bundle of energy is called a photon.

## ➤ Examples of Fields that Use Digital Image Processing (cont.)

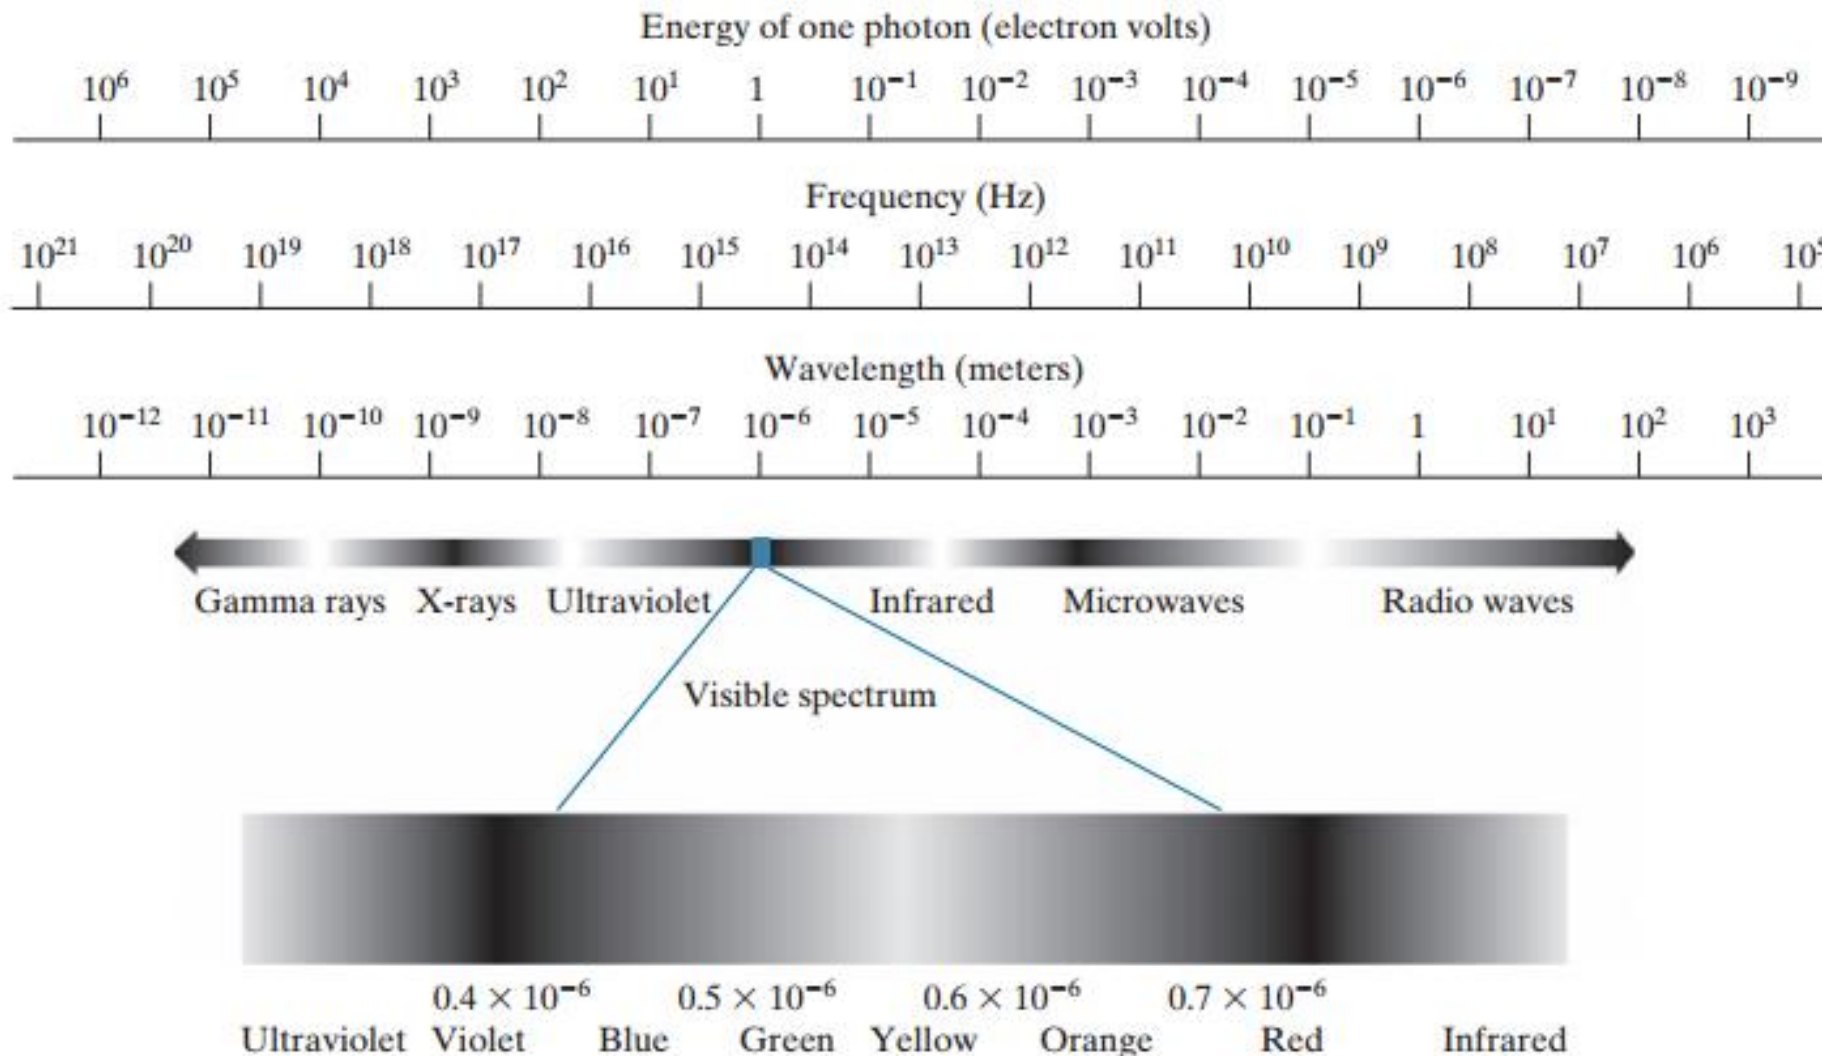

- If spectral bands are grouped according to energy per photon, we obtain the spectrum shown ranging from gamma rays (highest energy) at one end to radio waves (lowest energy) at the other.

**FIGURE** The electromagnetic spectrum arranged according to energy per photon.

# ➤ Examples of Fields that Use Digital Image Processing (cont.)

## ➤ Gamma-Ray Imaging

- Major uses of imaging based on gamma rays include **nuclear medicine** and **astronomical observations**. In nuclear medicine, the approach is to inject a patient with a radioactive isotope that emits gamma rays as it decays.
- Images are produced from the emissions collected by gamma ray detectors.

Figure (a) shows an image of a complete bone scan obtained by using gamma-ray imaging.

Images of this sort are used to locate sites of bone pathology, such as infections or tumors.

Figure (b) shows another major modality of nuclear imaging called positron emission tomography (PET).

## ➤ X-ray Imaging

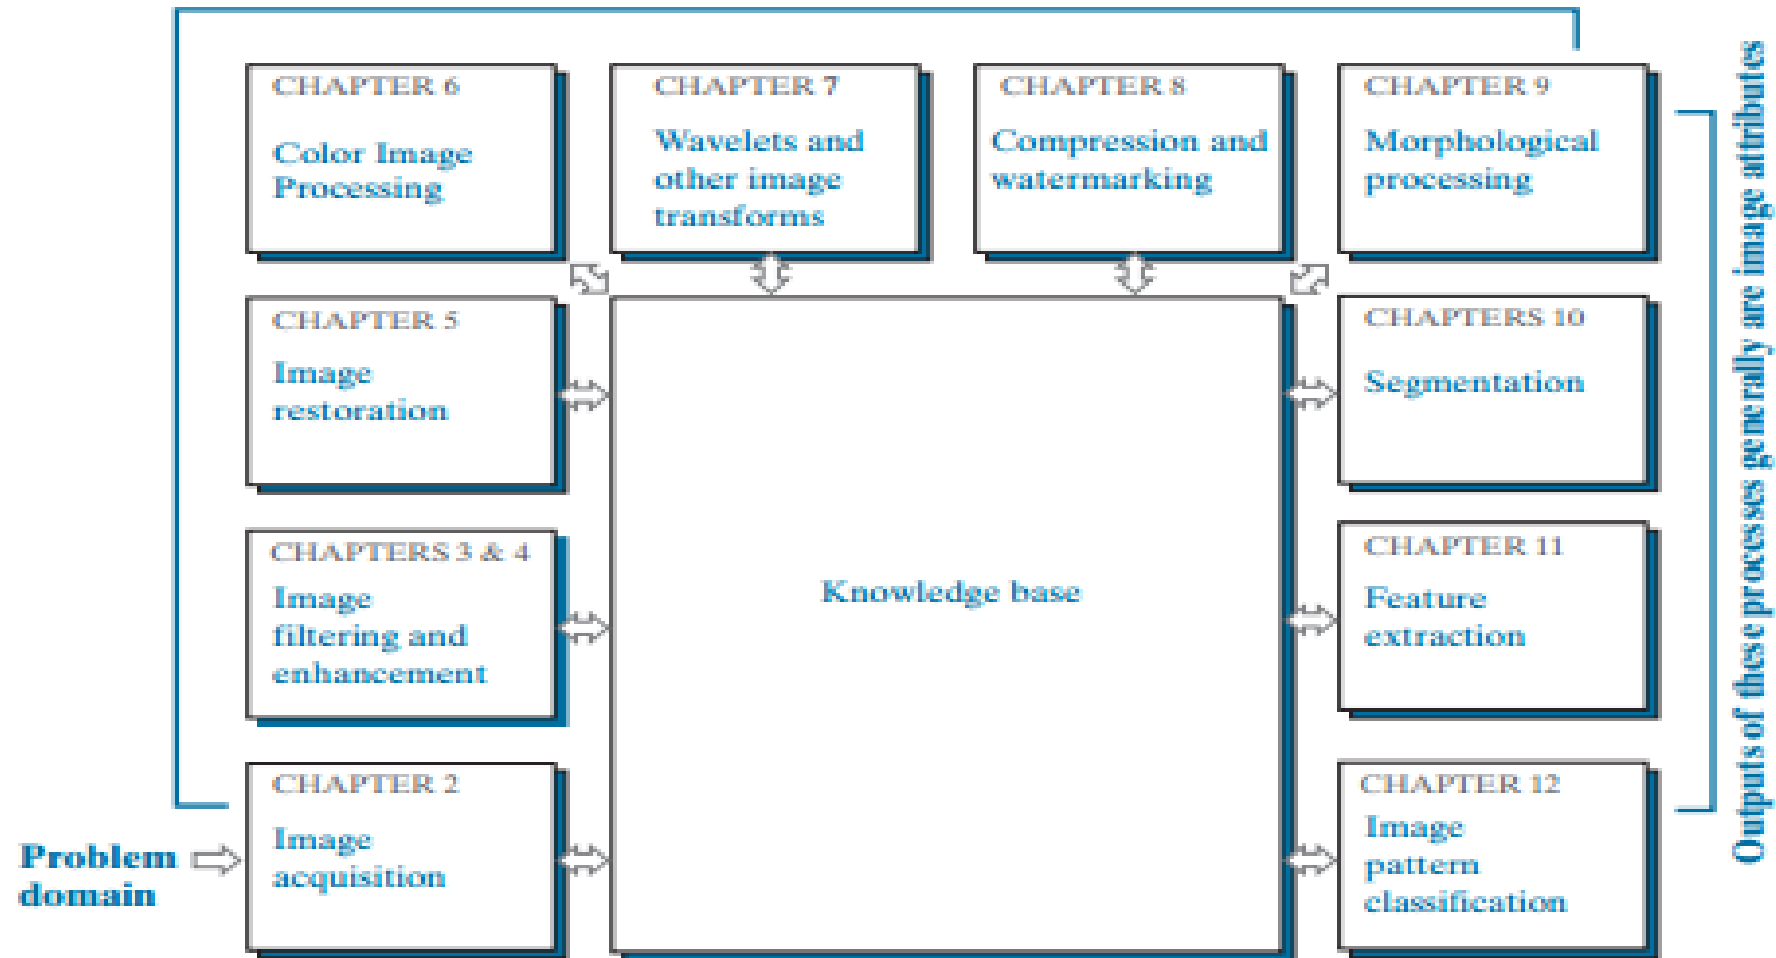

- X-rays are among the oldest sources of EM radiation used for imaging. The best-known use of X-rays is **medical diagnostics**, but they also are used extensively in **industry** and other areas, like **astronomy**.
- X-rays for medical and industrial imaging are generated using an X-ray tube, which is a vacuum tube with a cathode and anode.

Examples of X-ray imaging. (a) Chest X-ray. (b) Aortic angiogram. (c) Head CT.

# ➤ Fundamental steps in digital image processing.

Outputs of these processes generally are images

## ➤ Dimensionality of Digital Images

- Images and videos are multi-dimensional ( $\geq 2$  dimensions) signals.

## ➤ Structure of the Human Eye

- The eye is nearly a **sphere** (with a diameter of about 20 mm) enclosed by three membranes: the **cornea** and **sclera** outer cover; the choroid; and the **retina**. The cornea is a tough, transparent tissue that covers the anterior surface of the eye. Continuous with the cornea, the sclera is an opaque membrane that encloses the remainder of the optic globe. The choroid lies directly below the sclera. This membrane contains a network of blood vessels that serve as the major source of nutrition to the eye.

# ➤ The Human Visual System (HVS)

## ➤ HVS: Visual Illusion

Checker-shadow illusion:  
The squares marked A and B  
are the same shade of gray.

# MATLAB Tutorials

## ➤ Introduction to MATLAB

**MATLAB** : Matrix Laboratory

## **Numerical Computations with matrices**

- Every number can be represented as matrix

## **Why MATLAB?**

- User Friendly (GUI)
- Easy to work with
- Powerful tools for complex mathematics

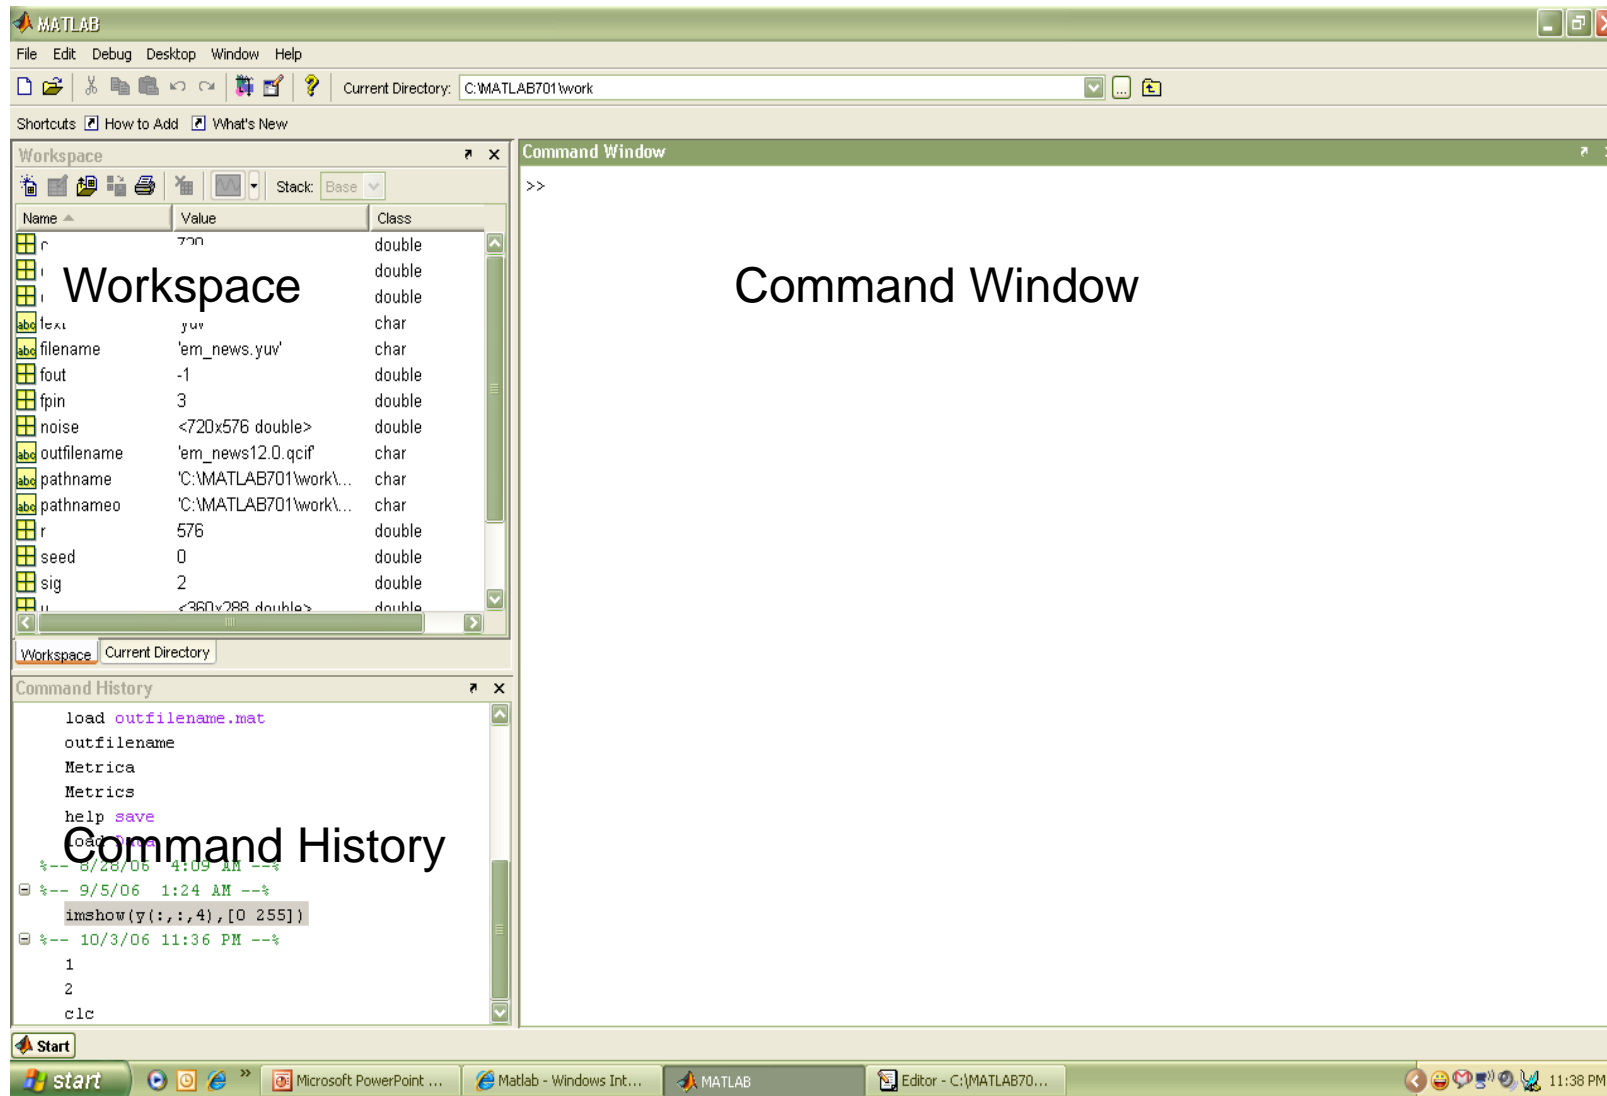

Fig: Snapshot of MATLAB

## ➤ **Matrices in MATLAB**

➤ To enter a matrix

3 1

6 4

>> A = [3 1 ; 6 4]

>> A = [3, 1 ; 6, 4]

>> B = [3, 5 ; 0, 2]

## ➤ Basic Mathematical Operations

Addition:

$$\gg C = A + B$$

Subtraction:

$$\gg D = A - B$$

Multiplication:

$$\gg E = A * B \text{ (Matrix multiplication)}$$

$$\gg E = A .* B \text{ (Element wise multiplication)}$$

Division:

Left Division and Right Division

$$\gg F = A ./ B \text{ (Element wise division)}$$

$$\gg F = A / B \text{ (A * inverse of B)}$$

$$\gg F = A . \setminus B \text{ (Element wise division)}$$

$$\gg F = A \setminus B \text{ (inverse of A * B)}$$

## ➤ **Generating basic matrices**

### **Matrix with ZEROS:**

```
>> Z = ZEROS (r, c)
```

### **Matrix with ONES:**

```
>> O = ONES (r, c)
```

### **IDENTITY Matrix:**

```
>> I = EYE (r, c)
```

r □ Rows

c □ Columns

zeros, ones, eye → MATLAB functions

## ➤ Image processing and MATLAB

- Easy to work with; as Images are matrices
- Built in functions for complex operations and algorithms (Ex. FFT, DCT, etc...)
- Image processing toolbox (?)
- Supports most image formats (.bmp, .jpg, .gif, .tiff, etc....)

| Format Name | Description                      | Recognized Extensions |
|-------------|----------------------------------|-----------------------|
| TIFF        | Tagged Image File Format         | .tif .tiff            |
| JPEG        | Joint Photographic Experts Group | .jpg .jpeg            |
| GIF         | Graphics Interchange Format      | .gif                  |
| BMP         | Windows Bitmap                   | .bmp                  |
| PNG         | Portable Network Graphics        | .png                  |
| XWD         | X Window Dump                    | .xwd                  |

## ➤ Image processing in MATLAB

### ➤ To read and display images

```
im = imread("filename.fmt")
```

im is (r \* c) if gray scale

im is (r \* c x 3) if color image (RGB)

```
imshow(im).....% displays image
```

```
imwrite(im, "filename.fmt").....% writes image
```

## ➤ Working with complex numbers

### ➤ real and imaginary

**real** ..... % real part of complex number

**imag** .....% imaginary part of complex number

### ➤ magnitude and phase

**abs** .....% magnitude of complex number

**angle** .....% phase of complex number

## ➤ **MATLAB Commands**

- `f= imread(chest.jpg); .....` reading the image
- `[r,c]= size(f); .....` gives rows and columns dimension of image
- `whos f .....` gives more information about image

```
Name          Size          Bytes          Class
f              1024x1024      1048576        uint8 array
Grand total is 1048576 elements using 1048576 bytes
```

- `imshow (f,G) .....` G is number of intensity levels if omitted it defaults to 256 levels.
- `imshow (f,[low high]) .....` Displays as black all values less than or equal low, and as white all values greater than or equal high
- `imshow (f,[ ]) .....` Sets variable low to minimum value of array f and high to its maximum value

## ➤ Data Classes

| Name          | Description                                                                                                       |
|---------------|-------------------------------------------------------------------------------------------------------------------|
| <b>double</b> | Double-precision, floating-point numbers in the approximate range -10308 to 1008 (8 bytes per element).           |
| uint8         | Unsigned 8-bit integers in the range (0,255] (1 byte per element).                                                |
| uint16        | Unsigned 16-bit integers in the range (0,65535) (2 bytes per element)                                             |
| uint32        | Unsigned 32-bit integers in the range 10, 4294967295] (4 bytes per element).                                      |
| int8          | Signed 8-bit integers in the range [-128, 127) (1 byte per element).                                              |
| int16         | Signed 16-bit integers in the range (-32768, 32767] (2 bytes per element).                                        |
| <b>int32</b>  | Signed 32-bit integers in the range [-2147483648, 2147483647) (4 bytes per element).                              |
| single        | Single-precision floating-point numbers with values in the approximate range -1038 to 1038 (4 bytes per element). |
| char          | Characters (2 bytes per element).                                                                                 |
| Logical       | Values are 0 or 1 (1 byte per element).                                                                           |

## ➤ Image Types

➤ Intensity images

➤ Binary images

➤ Indexed images

➤ RGB images

➤ Most monochrome images processing operations are carried out using **binary** or **intensity** images, so our initial focus is on these two image types.

## ➤ Converting between data classes and image types

- Converting between data classes

$B = \text{data\_class\_name}(A)$

- Converting between image types

$G = \text{im2uint8}(f)$

| Name      | Converts input to:     | Valid input image data classes     |
|-----------|------------------------|------------------------------------|
| im2uint8  | uint8                  | Logical, uint8, uint16, and double |
| im2uint16 | uint16                 | Logical, uint8, uint16, and double |
| mat2gray  | Double(in range [0,1]) | Double                             |
| im2double | double                 | Logical, uint8, uint16, and double |
| im2bw     | Logical                | uint8, uint16, and double          |

## ➤ Array Indexing

### ➤ Vector indexing

```
>> V = [ 1 3 5 7 9 ];
```

```
>> v(3)
```

```
ans = 5
```

Ex2:-

```
>> w = v' ;
```

transpose operator to convert row to column

Ex3:-

```
>>v(1:3)
```

```
ans = 1 3 5
```

## ➤ Array Indexing

```
>> v(3:end)
```

```
ans= 5 7 9
```

```
>> v(1:2:end)
```

```
ans= 1 5 9
```

mean starts with 1 and jumps with 2 to the end

```
>> v(end:-2:1)
```

```
ans= 9 5 1
```

## ➤ Matrix Indexing

```
>> A=[1 2 3;4 5 6;7 8 9];
```

```
>>A(2,3)
```

```
ans= 6
```

```
>>A(2,:)
```

```
Ans= 4 5 6
```

```
>>A(:,3)=0
```

```
Ans= 1 2 0
```

```
4 5 0
```

```
7 8 0
```

```
>>A(:,3)
```

```
Ans= 3
```

```
6
```

```
9
```

```
>>A(1:2,2:3)
```

```
Ans= 2 3
```

```
5 6
```

```
>>A(end,end)
```

```
Ans= 9
```

## ➤ Matrix Indexing

```
>> A(end, end-2)
```

```
Ans= 7
```

```
>> A(2:end , end:-2:1)
```

```
Ans= 6 4
```

```
9 7
```

```
>>A([1 3] , [2 3])
```

```
Ans= 2 3
```

```
8 9
```

## ➤ Important Standard Arrays

| Command                   | Description                                                                                                                                                                                                                                              |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>zeros(M, N)</code>  | generates an MxN matrix of Os of class double.                                                                                                                                                                                                           |
| <code>ones (M, N)</code>  | generates an MxN matrix of 1s of class double.                                                                                                                                                                                                           |
| <code>true (M, N)</code>  | generates an MxN logical matrix of 1s                                                                                                                                                                                                                    |
| <code>false (M, N)</code> | generates an M x N logical matrix of Os                                                                                                                                                                                                                  |
| <code>magic (M)</code>    | generates an M x M "magic square." This is a square array in which the sum along any row, column, or main diagonal, is the same. Magic squares are useful arrays for testing purposes because they are easy to generate, and their numbers are integers. |
| <code>rand(M, N)</code>   | generates an MxN matrix whose entries are uniformly distributed random numbers in the interval (0,1)                                                                                                                                                     |
| <code>randn (M, N)</code> | generates an Mx N matrix whose numbers are normally distributed (i.e., Gaussian) random numbers with mean 0 and variance 1.                                                                                                                              |

## ➤ Arithmetic operators

| Operator | Name                                          | MATLAB Function | Comments and Examples                                                                                         |
|----------|-----------------------------------------------|-----------------|---------------------------------------------------------------------------------------------------------------|
| +        | Array and matrix addition                     | plus(A, B)      | $a + b$ , $A + B$ , or $a + A$ .                                                                              |
| -        | Array and matrix subtraction                  | minus(A, B)     | $a - b$ , $A - B$ , $A - a$ , or $a - A$ .                                                                    |
| .*       | Array multiplication                          | times(A, B)     | $C = A .* B$ , $C(I, J) = A(I, J) * B(I, J)$ .                                                                |
| *        | Matrix multiplication                         | mtimes(A, B)    | $A * B$ , standard matrix multiplication, or $a * A$ , multiplication of a scalar times all elements of $A$ . |
| ./       | Array right division                          | rdivide(A, B)   | $C = A ./ B$ , $C(I, J) = A(I, J) / B(I, J)$ .                                                                |
| .\       | Array left division                           | ldivide(A, B)   | $C = A .\ B$ , $C(I, J) = B(I, J) / A(I, J)$ .                                                                |
| /        | Matrix right division                         | mrdivide(A, B)  | $A / B$ is roughly the same as $A * \text{inv}(B)$ , depending on computational accuracy.                     |
| \        | Matrix left division                          | mldivide(A, B)  | $A \setminus B$ is roughly the same as $\text{inv}(A) * B$ , depending on computational accuracy.             |
| .^       | Array power                                   | power(A, B)     | If $C = A .^ B$ , then $C(I, J) = A(I, J) ^ B(I, J)$ .                                                        |
| ^        | Matrix power                                  | mpower(A, B)    | See online help for a discussion of this operator.                                                            |
| .'       | Vector and matrix transpose                   | transpose(A)    | $A'$ . Standard vector and matrix transpose.                                                                  |
| '        | Vector and matrix complex conjugate transpose | ctranspose(A)   | $A'$ . Standard vector and matrix conjugate transpose. When $A$ is real $A' = A'$ .                           |
| +        | Unary plus                                    | uplus(A)        | $+A$ is the same as $0 + A$ .                                                                                 |
| -        | Unary minus                                   | uminus(A)       | $-A$ is the same as $0 - A$ or $-1 * A$ .                                                                     |
| :        | Colon                                         |                 | Discussed in Section 2.8.                                                                                     |

## ➤ Logical operators

| Function           | Comments                                                                                                                                                |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| xor (exclusive OR) | The xor function returns a 1 only if both operands are logically different; otherwise xor returns a 0.                                                  |
| all                | The all function returns a 1 if all the elements in a vector are nonzero; otherwise, all returns a 0. This function operates column wise on matrices.   |
| any                | The any function returns a 1 if any of the elements in a vector is nonzero; otherwise, any returns a 0. This function operates column wise on matrices. |

## ➤ Flow control

| Statement   | Description                                                                                                                 |
|-------------|-----------------------------------------------------------------------------------------------------------------------------|
| if          | if, together with else and elseif, executes a group of statements based on a specified logical condition.                   |
| for         | Executes a group of statements a fixed (specified) number of times.                                                         |
| while       | Executes a group of statements an indefinite number of times, based on a specified logical condition.                       |
| break       | Terminates execution of a for or while loop.                                                                                |
| continue    | Passes control to the next iteration of a for or while loop, skipping any remaining statements in the body of the loop.     |
| switch      | switch, together with case and otherwise, executes different groups of statements, depending on a specified value or string |
| return      | Causes execution to return to the invoking function.                                                                        |
| try...catch | Changes flow control if an error is detected during execution.                                                              |

## ➤ **Plotting / displaying**

### ➤ **PLOT(x,y)**

Plots y versus x.

Linear plot

XLABEL('label')

YLABEL('label')

TITLE('title')

### ➤ **IMAGE(x)**

Displays image

### ➤ **3D PLOT:**

#### **MESH**

3D mesh surface (Ex. filters)

#### **MESHGRID**

Useful in 3D plots

#### **SURF**

3D colored surface (Ex. filters)

Thank  
you
